

The FCC must NOT accept the proposals of LightSquared. I use GPS to navigate in cars and to access a growing number of telephone services. LightSquared's proposals will reduce my quality of life without any possible compensation.

The strength of the LightSquared signal in an MSS band is out of line with years of frequency management by the FCC, and studies have shown that GPS receivers will be harmed by the Lightsquared signals. Even the proposals to use only part of the requested bandwidth will still result in millions of GPS receivers needing to be modified—and the technology to modify those GPS receivers is not yet developed in many cases.

If we need nationwide broadband, let's get a different frequency.
